<p>NOVELTY Raw water containing phosphorous is introduced to the lower portion of the reactor. Magnesium hydroxide, sulfuric acid and ammonium ion are added through respective supply ports to water to form magnesium ammonium phosphate (MAP) and the treated water is collected from the upper portion.</p> <p>USE For removal of phosphorous from ground water, sewage, faeces, urine or waste water.</p> <p>ADVANTAGE Dephosphorizing process is carried out efficiently by using magnesium hydroxide.</p>
